Farmer LinkedIn (Smart Agri Workforce Platform)

ABSTRACT:

Agriculture in India faces major challenges in finding reliable labor, fair wages, and efficient land utilization. Existing agricultural applications mainly focus on advisory services, machinery rental, or market prices, but lack an integrated system for workforce and land management. This project proposes a smart digital platform that connects farmers, agricultural workers, and landowners through a unified network. The system provides AI-based worker recommendations using location, skill type, availability, ratings, and cost. A daily wage prediction module helps ensure fair pricing for both farmers and workers. Crop and season-based labor planning assists farmers in estimating workforce requirements and costs. Voice-based interaction with Telugu language support improves accessibility for rural users. The platform also includes a worker availability calendar and an emergency labor request system. A land-sharing module enables farmer-to-farmer land rental and crop-sharing agreements. Trust and safety are ensured through OTP verification, ratings, and work history tracking. Weather alerts support better decision-making during farming operations. Overall, the proposed system aims to improve efficiency, transparency, and sustainability in agricultural labor and land management
